6440 *Juncus*

Wet, sphagnum woods near P.M. Bay #1. 7/8/19

Note on 6428 I am rather doubtful as to the determination of this specimen. From the under surface the specimen has the appearance of *L. glaucum* (L.) Schimp. but from above that of *L. albidum* (Brid.) Lindb. From the general ~~st~~ habit of growth ~~and~~ and due to the fact that *L. albidum* is quite common in this vicinity I rather suspect it being that species. (*albidum*)

Grout states in his *Mosses with Hand Lens & Microscope* page 109, that *L. albidum* "seems to be rare"; however I find it quite common in different localities of the O.C. and there can ~~be~~ hardly be any mistaking as its small rug fruit is quite characteristic.

Sandy bog, inner dunes, Cape Henry, Va.

Note on 6744. Kearney in Cont. from U.S. N.H. Rep on a Bot Survey of the District Swamp Region lists only 2 *Dicranum* namely *D. scoparium* and *D. flagellare*. This specimen resembles *D. flagellare* but in no case have I found *D. flagellare* growing any where but on rotten wood. Habitat and cell characters indicate that this is *D. sabuletorum* described by Renoult and Cardot in Bot Gay. 14<sup>e</sup>: 96. 1889.
